Environmental Protection Tips - Cooling
環保小貼士 -冷氣篇

中文 **English**

In summer, most of us switch on air-conditioners for making ourselves comfortable. Cooling accounts for a high percentage of energy consumption in a family, making it the largest energy expense for most homes. In fact, we can save money and increase comfort by adapting the following "Cooling Tips".

- Clean filters once a month or as needed.
- Pull down the shades on the sunny side of your room.
- Adapt a casual dress code* in summer if possible.
- Turn off the air-conditioner if the room will be unoccupied for an extended period.
- Adjust the thermostats to 25°C or higher.

Your little effort would be very helpful to the environment!
